

# Are the Pores of Your Teeth Clogged with Plaque, Stains, and Other Impurities?

**L**AVADENT™ was designed to provide a unique method of teeth whitening by cleaning out pores with an ionic action that helps to minimize pore size. The pH balancing assistance supports saliva during its remineralizing of enamel. Minerals from Italian lava clay and bamboo tabasheer help to boost the whitening and polishing process.

# NaturaRx™

LAVADENT™

100% Natural  
Teeth Whitening

## Mineral Whitening with the Power of Lava

- ❖ Lavadent™ is for people who want to whiten without bleaching their teeth. No carbamide peroxide. No whitening trays or strips. No chemical whitening agents. No hassels or potential toxicity.
- ❖ The whitening potential of Lavadent™ occurs from a gentle yet powerful, ionic surface stain removal and polishing process. It will not provide a white that resembles bleached paper. This whitening is a white aligned to an individual's natural shade of white - ivory or "pearly" white.
- ❖ As with skin, teeth have pores that need cleaning. They hold plaque and stains that are very difficult to remove with common tooth brushing. Lavadent™ helps to powerfully draw out impurities from both teeth and gums.
- ❖ Bacteria contained in plaque remaining in teeth pores can find their way through the dentinal tubules that lead to teeth nerve centers. They often make teeth more sensitive. Lavadent™ helps contribute to processes that lift out these pain and odor-causing impurities by lifting out the plaque that contains them.
- ❖ Saliva builds, heals, and maintains tissues of the mouth. When the pH of saliva is in its normal, slightly alkaline state, it is able to perform teeth remineralizing. Lavadent™ supports this process.
- ❖ Thin enamel displays a yellowish-colored underlayer of dentin. The more remineralization occurs, the less the dentin will show through. . . helping the teeth reflect light and shine.
